| Team ID | 6ab4a4a60fc666a751b434a8 |
| Project Name | Auto Ticket Classification using Flow Designer |
| Maximum Marks | 2 Marks |

**Proposed Solution Template:**

Project team shall fill the following information in the proposed solution template.

| S.No. | Parameter | Description |
|---|---|---|
| 1. | Problem Statement (Problem to be solved) | Campus IT support teams face heavy triage delays, routing backlogs, and classroom downtime due to non-technical users submitting generic tickets without proper category details. |
| 2. | Idea / Solution description | A ServiceNow Flow Designer solution that automatically parses keywords in the short description (Wi-Fi, Projector, Password), dynamically populates dependent Category/Subcategory fields, assigns the correct team, and sends an immediate email acknowledgment. |
| 3. | Novelty / Uniqueness | Provides real-time, automated ticket triage directly within the ServiceNow cloud platform using low-code/no-code Flow Designer logic, removing the dependency on costly third-party AI plug-ins or dedicated manual dispatchers. |
| 4. | Social Impact / Customer Satisfaction | Minimizes classroom interruptions and lost lecture time for teachers and students, eliminates manual form confusion, and delivers instant transparency via automated confirmation emails. |
| 5. | Business Model (Revenue Model) | Delivers internal operational cost savings (ROI) by cutting manual service desk triage effort, with potential to package as a reusable ServiceNow Store utility/managed service for academic institutions. |
| 6. | Scalability of the Solution | Operates natively on the ServiceNow multi-instance cloud architecture, allowing seamless scaling to support thousands of campus incidents and flexible rule expansion for new departments. |
